Now go, write it before them in a table, and note it in a book.

— Isaiah 30:8

To go beyond is as wrong as to fall short.

— Confucius

Begin at the beginning,… and go on till you come to the end: then stop.

— Lewis Carroll

OBJECTIVES

In this chapter you will learn:

- What arrays are.
- To use arrays to store data in and retrieve data from lists and tables of values.
- To declare an array, initialize an array and refer to individual elements of an array.
- To use the enhanced `for` statement to iterate through arrays.
- To pass arrays to methods.
- To declare and manipulate multidimensional arrays.
- To write methods that use variable-length argument lists.
- To read command-line arguments into a program.

Outline

© 1992-2007 Pearson Education, Inc. All rights reserved.

7.1 Introduction

- **Arrays**
  - **Data structures**
  - **Related data items of same type**
  - **Remain same size once created**
    - **Fixed-length entries**

© 1992-2007 Pearson Education, Inc. All rights reserved.

7.2 Arrays

- **Array**
  - **Group of variables**
    - **Have same type**
  - **Reference type**

© 1992-2007 Pearson Education, Inc. All rights reserved.

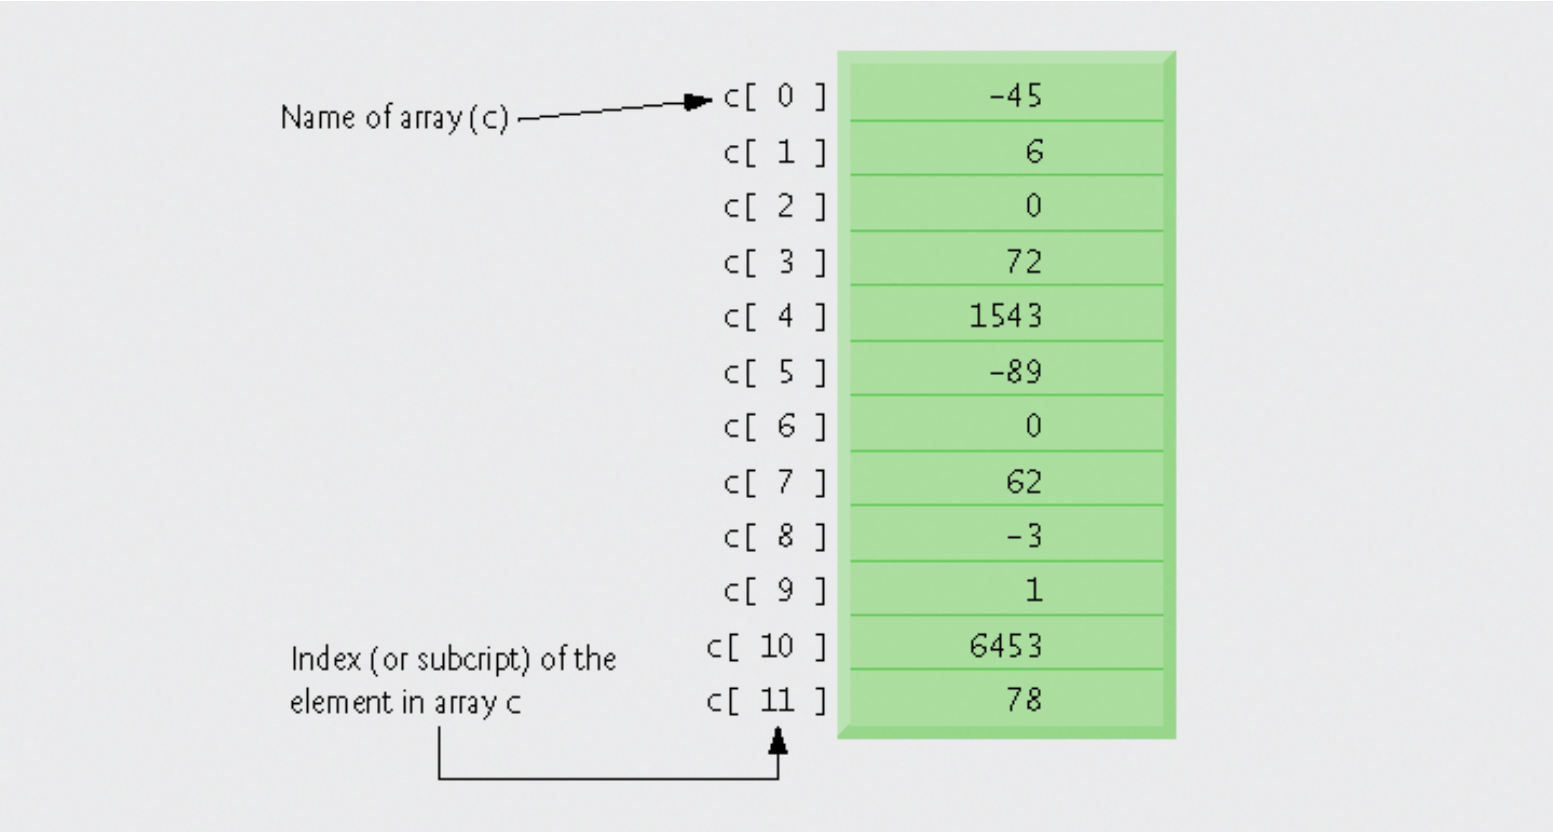

Fig. 7.1 | A 12-element array.

© 1992-2007 Pearson Education, Inc. All rights reserved.

7.2 Arrays (Cont.)

- **Index**
  - **Also called subscript**
  - **Position number in square brackets**
  - **Must be positive integer or integer expression**
  - **First element has index zero**

```
a = 5;
b = 6;
c[ a + b ] += 2;
```

- **Adds `2` to `c[ 11 ]`**

© 1992-2007 Pearson Education, Inc. All rights reserved.

Common Programming Error 7.1

Using a value of type `long` as an array index results in a compilation error. An index must be an `int` value or a value of a type that can be promoted to int—namely, `byte`, `short` or `char`, but not `long`.

© 1992-2007 Pearson Education, Inc. All rights reserved.

7.2 Arrays (Cont.)

- **Examine array `c`**
  - **`c` is the array *name***
  - **`c.length` accesses array `c`'s *length***
  - **`c` has 12 *elements* (`c[0]`, `c[1]`, … `c[11]`)**
    - **The *value* of `c[0]` is `-45`**

© 1992-2007 Pearson Education, Inc. All rights reserved.

7.3 Declaring and Creating Arrays

- **Declaring and Creating arrays**
  - **Arrays are objects that occupy memory**
  - **Created dynamically with keyword new**

```
int c[] = new int[ 12 ];
```

    - **Equivalent to**

```
int c[];  // declare array variable
c = new int[ 12 ]; // create array
```

  - **We can create arrays of objects too**

```
String b[] = new String[ 100 ];
```

© 1992-2007 Pearson Education, Inc. All rights reserved.

Common Programming Error 7.2

In an array declaration, specifying the number of elements in the square brackets of the declaration (`e.g., int c[ 12 ];`) is a syntax error.

© 1992-2007 Pearson Education, Inc. All rights reserved.

Good Programming Practice 7.1

For readability, declare only one variable per declaration. Keep each declaration on a separate line, and include a comment describing the variable being declared.

© 1992-2007 Pearson Education, Inc. All rights reserved.

Common Programming Error 7.3

Declaring multiple array variables in a single declaration can lead to subtle errors. Consider the declaration `int[] a, b, c;`. If `a`, `b` and `c` should be declared as array variables, then this declaration is correct—placing square brackets directly following the type indicates that all the identifiers in the declaration are array variables. However, if only `a` is intended to be an array variable, and `b` and `c` are intended to be individual int variables, then this declaration is incorrect—the declaration `int a[], b, c;` would achieve the desired result.

© 1992-2007 Pearson Education, Inc. All rights reserved.

7.4 Examples Using Arrays

- **Declaring arrays**
- **Creating arrays**
- **Initializing arrays**
- **Manipulating array elements**

© 1992-2007 Pearson Education, Inc. All rights reserved.

7.4 Examples Using Arrays

- **Creating and initializing an array**
  - **Declare array**
  - **Create array**
  - **Initialize array elements**

© 1992-2007 Pearson Education, Inc. All rights reserved.

```
1  // Fig. 7.2: InitArray.java
2  // Creating an array.
3
4  public class InitArray
5  {
6     public static void main( Stri
7     {
8        int array[]; // declare array named array
9
10       array = new int[ 10 ]; // create the sp
11
12       System.out.printf( "%s%8s\n", "Index", "Value" ); // column headings
13
14       // output each array element's value
15       for ( int counter = 0; counter < array.length; counter++ )
16          System.out.printf( "%5d%8d\n", counter, array[ counter ] );
17    } // end main
18 } // end class InitArray
```

```
Index   Value
    0       0
    1       0
    2       0
    3       0
    4       0
    5       0
    6       0
    7       0
    8       0
    9       0
```

Declare `array` as an array of `int`s

Create 10 `int`s for `array`; each `int` is initialized to 0 by default

`array.length` returns length of `array`

Each `int` is initialized to 0 by default

`array[counter]` returns `int` associated with index in `array`

Outline

InitArray.java

Line 8
Declare array as an array of **int**s

Line 10
Create 10 **int**s for array; each **int** is initialized to **0** by default

Line 15
array.length returns length of array

Line 16
array[counter] returns **int** associated with index in array

Program output

7.4 Examples Using Arrays (Cont.)

- **Using an array initializer**
  - Use *initializer list*
    - Items enclosed in braces ({})
    - Items in list separated by commas

```
int n[] = { 10, 20, 30, 40, 50 };
```

      - Creates a five-element array
      - Index values of 0, 1, 2, 3, 4
  - Do not need keyword `new`

© 1992-2007 Pearson Education, Inc. All rights reserved.

```
1  // Fig. 7.3: InitArray.java
2  // Initializing the elements of an array with an array initializer.
3
4  public class InitArray
5  {
6     public static void main( String args[] )
7     {
8        // initializer list specifies the value for each element
9        int array[] = { 32, 27, 64, 18, 95, 14, 90, 70, 60, 37 };
10
11       System.out.printf( "%s%8s\n", "Index", "Value" ); // column headings
12
13       // output each array element's value
14       for ( int counter = 0; counter < array.length; counter++ )
15          System.out.printf( "%5d%8d\n", counter, array[ counter ] );
16    } // end main
17 } // end class InitArray
```

Declare `array` as an array of `int`s

Compiler uses initializer list to allocate array

```
Index   Value
    0      32
    1      27
    2      64
    3      18
    4      95
    5      14
    6      90
    7      70
    8      60
    9      37
```

Outline

itArray.java

Line 9
Declare array as an array of ints

Line 9
Compiler uses initializer list to allocate array

Program output

7.4 Examples Using Arrays (Cont.)

- **Calculating a value to store in each array element**
  - **Initialize elements of 10-element array to even integers**

© 1992-2007 Pearson Education, Inc. All rights reserved.

```
1  // Fig. 7.4: InitArray.java
2  // Calculating values to be placed into elements of an array.
3
4  public class InitArray
5  {
6     public static void main( String args[] )
7     {
8        final int ARRAY_LENGTH = 10; // declare constant
9        int array[] = new int[ ARRAY_LENGTH ]; // create ar
10
11       // calculate value for each array element
12       for ( int counter = 0; counter < array.length; counter++ )
13          array[ counter ] = 2 + 2 * counter;
14
15       System.out.printf( "%s%8s\n", "Index", "Value" ); // column headings
16
17       // output each array element's value
18       for ( int counter = 0; counter < array.length; counter++ )
19          System.out.printf( "%5d%8d\n", counter
20    } // end main
21 } // end class InitArray
```

```
Index   Value
    0       2
    1       4
    2       6
    3       8
    4      10
    5      12
    6      14
    7      16
    8      18
    9      20
```

Declare constant variable ARRAY_LENGTH using the `final` modifier

Declare and create `array` that contains 10 `int`s

Use `array` index to assign array value

Outline

InitArray.java

8
are constant
variable

Line 9
Declare and
create array that
contains 10 **int**s

Line 13
Use array index
to assign array

Program output

Good Programming Practice 7.2

Constant variables also are called named constants or read-only variables. Such variables often make programs more readable than programs that use literal values (e.g., 10)—a named constant such as ARRAY_LENGTH clearly indicates its purpose, whereas a literal value could have different meanings based on the context in which it is used.

© 1992-2007 Pearson Education, Inc. All rights reserved.

Common Programming Error 7.4

Assigning a value to a constant after the variable has been initialized is a compilation error.

© 1992-2007 Pearson Education, Inc. All rights reserved.

Common Programming Error 7.5

Attempting to use a constant before it is initialized is a compilation error.

© 1992-2007 Pearson Education, Inc. All rights reserved.

7.4 Examples Using Arrays (Cont.)

- **Summing the elements of an array**
  - **Array elements can represent a series of values**
    - **We can sum these values**

© 1992-2007 Pearson Education, Inc. All rights reserved.

```
1  // Fig. 7.5: SumArray.java
2  // Computing the sum of the elements of
3
4  public class SumArray
5  {
6     public static void main( String args[] )
7     {
8        int array[] = { 87, 68, 94, 100, 83, 78, 85, 91, 76, 87 };
9        int total = 0;
10
11       // add each element's value to total
12       for ( int counter = 0; counter < array.length; counter++ )
13          total += array[ counter ];
14
15       System.out.printf( "Total of array elements: %d\n",    total );
16    } // end main
17 } // end class SumArray
```

Declare `array` with initializer list

Sum all `array` values

```
Total of array elements: 849
```

Outline

SumArray.java

Line 8
Declare array with initializer list

Lines 12-13
Sum all array values

Program output

7.4 Examples Using Arrays (Cont.)

- **Using bar charts to display array data graphically**
  - **Present data in graphical manner**
    - **E.g., bar chart**
  - **Examine the distribution of grades**

© 1992-2007 Pearson Education, Inc. All rights reserved.

Outline

BarChart.java

(1 of 2)

Line 8
Declare array with initializer list

Line 19
Use the **0** flag to display one-digit grade with a leading 0

```
1  // Fig. 7.6: BarChart.java
2  // Bar chart printing program.
3
4  public class BarChart
5  {
6     public static void main( String args[] )
7     {
8        int array[] = { 0, 0, 0, 0, 0, 0, 1, 2, 4, 2, 1 };
9
10       System.out.println( "Grade distribution:" );
11
12       // for each array element, output a bar of the chart
13       for ( int counter = 0; counter < array.length; counter++ )
14       {
15          // output bar label ( "00-09: ", ..., "90-99: ", "100: " )
16          if ( counter == 10 )
17             System.out.printf( "%5d: ", 100 );
18          else
19             System.out.printf( "%02d-%02d: ",
20                counter * 10, counter * 10 + 9 );
21
22          // print bar of asterisks
23          for ( int stars = 0; stars < array[ counter ]; stars++ )
24             System.out.print( "*" );
25
26          System.out.println(); // start a new line of output
27       } // end outer for
28    } // end main
29 } // end class BarChart
```

Declare `array` with initializer list

Use the `0` flag to display one-digit grade with a leading 0

For each `array` element, print associated number of asterisks

7.4 Examples Using Arrays (Cont.)

- **Using arrays to analyze survey results**
  - **40 students rate the quality of food**
    - **1–10 Rating scale: 1 means awful, 10 means excellent**
  - **Place 40 responses in array of integers**
  - **Summarize results**

© 1992-2007 Pearson Education, Inc. All rights reserved.

Outline

```
1  // Fig. 7.8: StudentPoll.java
2  // Poll analysis program.
3
4  public class StudentPoll
5  {
6     public static void main( String args[] )
7     {
8        // array of survey responses
9        int responses[] = { 1, 2, 6, 4, 8, 5, 9, 7, 8, 10,
10          10, 3, 8, 2, 7, 6, 5, 7, 6, 8, 6, 7, 5, 6, 6, 5
11          4, 8, 6, 8, 10 };
12       int frequency[] = new int[ 11 ]; // array of frequency counters
13
14       // for each answer, select responses element and use that value
15       // as frequency index to determine element to increment
16       for ( int answer = 0; answer < responses.length; answer++ )
17          ++frequency[ responses[ answer ] ];
18
19       System.out.printf( "%s%10s", "Rating", "Frequency" );
20
21       // output each array element's value
22       for ( int rating = 1; rating < frequency.length; rating++ )
23          System.out.printf( "%d%10d", rating, frequency[ rating ] );
24    } // end main
25 } // end class StudentPoll
```

Declare `responses` as array to store 40 responses

Declare `frequency` as array of 11 `int` and ignore the first element

For each response, increment `frequency` values at index associated with that response

StudentPoll.java

(1 of 2)

onses as array to store 40 responses

Error-Prevention Tip 7.1

An exception indicates that an error has occurred in a program. A programmer often can write code to recover from an exception and continue program execution, rather than abnormally terminating the program. When a program attempts to access an element outside the array bounds, an `ArrayIndexOutOfBoundsException` occurs. Exception handling is discussed in Chapter 13.

© 1992-2007 Pearson Education, Inc. All rights reserved.

Error-Prevention Tip 7.2

When writing code to loop through an array, ensure that the array index is always greater than or equal to 0 and less than the length of the array. The loop-continuation condition should prevent the accessing of elements outside this range.

7.5 Case Study: Card Shuffling and Dealing Simulation

- **Program simulates card shuffling and dealing**
  - **Use random number generation**
  - **Use an array of reference type elements to represent cards**
  - **Three classes**
    - **Card**
      - **Represents a playing card**
    - **DeckOfCards**
      - **Represents a deck of 52 playing cards**
    - **DeckOfCardsTest**
      - **Demonstrates card shuffling and dealing**

© 1992-2007 Pearson Education, Inc. All rights reserved.

```
1  // Fig. 7.9: Card.java
2  // Card class represents a playing card.
3
4  public class Card
5  {
6     private String face; // face of card ("Ace", "Deuce", ...)
7     private String suit; // suit of card ("Hearts", "Diamonds", ...)
8
9     // two-argument constructor initializes card's face and suit
10    public Card( String cardFace, String cardSuit )
11    {
12       face = cardFace; // initialize face of card
13       suit = cardSuit; // initialize suit of card
14    } // end two-argument Card constructor
15
16    // return String representation of Card
17    public String toString()
18    {
19       return face + " of " + suit;
20    } // end method toString
21 } // end class Card
```

Return the string representation of a card

Outline

Card.java

```
1  // Fig. 7.10: DeckOfCards.java
2  // DeckOfCards class represents a deck of playing cards.
3  import java.util.Random;
4
5  public class DeckOfCards
6  {
7     private Card deck[]; // array of Card objects
8     private int currentCard; // index of next Card to be dea
9     private final int NUMBER_OF_CARDS = 52; // constant number of Cards
10    private Random randomNumbers; // random number generator
11
12    // constructor fills deck of Cards
13    public DeckOfCards()
14    {
15       String faces[] = { "Ace", "Deuce
16          "Seven", "Eight", "Nine", "Te
17       String suits[] = { "Hearts", "Di
18
19       deck = new Card[ NUMBER_OF_CARDS ]; // create array of Card objects
20       currentCard = 0; // set currentCard so first Card dealt is deck[ 0 ]
21       randomNumbers = new Random(); // create random nu
22
23       // populate deck with Card objects
24       for ( int count = 0; count < deck.length; count++ )
25          deck[ count ] =
26             new Card( faces[ count % 13 ], suits[ count / 13 ] );
27    } // end DeckOfCards constructor
```

Declare `deck` as array to store `Card` objects

Constant `NUMBER_OF_CARDS` indicates the number of Cards in the deck

Declare and initialize `faces` with `String`s that represent the face of card

Declare and initialize `suits` with `String`s that represent the suit of card

Fill the `deck` array with `Card`s

7.6 Enhanced `for` Statement

- **Enhanced `for` statement**
  - **Iterates through elements of an array or a collection without using a counter**
  - **Syntax**

```
for ( parameter : arrayName )
   statement
```

© 1992-2007 Pearson Education, Inc. All rights reserved.

Outline

EnhancedForTest.java

```
1  // Fig. 7.12: EnhancedForTest.java
2  // Using enhanced for statement to total integers in an array.
3
4  public class EnhancedForTest
5  {
6     public static void main( String args[] )
7     {
8        int array[] = { 87, 68, 94, 100, 83, 78, 85, 91, 76, 87 };
9        int total = 0;
10
11       // add each element's value to total
12       for ( int number : array )
13          total += number;
14
15       System.out.printf( "Total of array elements: %d\n", total );
16    } // end main
17 } // end class EnhancedForTest
```

```
Total of array elements: 849
```

For each iteration, assign the next element of `array` to `int` variable `number`, then add it to `total`

© 1992-2007 Pearson Education, Inc. All rights reserved.

7.6 Enhanced `for` Statement (Cont.)

- **Lines 12-13 are equivalent to**

```
for ( int counter = 0; counter < array.length; counter++ )
    total += array[ counter ];
```

- **Usage**
  - **Can access array elements**
  - **Cannot modify array elements**
  - **Cannot access the counter indicating the index**

© 1992-2007 Pearson Education, Inc. All rights reserved.

7.7 Passing Arrays to Methods

- **To pass array argument to a method**
  - **Specify array name without brackets**
    - **Array `hourlyTemperatures` is declared as**

```
int hourlyTemperatures = new int[ 24 ];
```

    - **The method call**

```
modifyArray( hourlyTemperatures );
```

    - **Passes array `hourlyTemperatures` to method `modifyArray`**

© 1992-2007 Pearson Education, Inc. All rights reserved.

```
1  // Fig. 7.13: PassArray.java
2  // Passing arrays and individual array elements to methods.
3
4  public class PassArray
5  {
6     // main creates array and calls modifyArray and modifyElement
7     public static void main( String args[] )
8     {
9        int array[] = { 1, 2, 3, 4, 5 };
10
11       System.out.println(
12          "Effects of passing reference to entire array:\n" +
13          "The values of the original array are:" );
14
15       // output original array elements
16       for ( int value : array )
17          System.out.printf( "   %d", value );
18
19       modifyArray( array ); // pass array reference
20       System.out.println( "\n\nThe values of the modified array are:" );
21
22       // output modified array elements
23       for ( int value : array )
24          System.out.printf( "   %d", value );
25
26       System.out.printf(
27          "\n\nEffects of passing array element value:\n" +
28          "array[3] before modifyElement: %d\n", array[ 3 ] );
```

Declare 5-`int` `array` with initializer list

Pass entire array to method `modifyArray`

Outline

`PassArray.java`

(1 of 2)

Line 9

Line 19

© 1992-2007 Pearson Education, Inc. All rights reserved.

```
29
30       modifyElement( array[ 3 ] ); // attempt to modify array[ 3 ]
31       System.out.printf(
32          "array[3] after modifyElement
33    } // end main
34
35    // multiply each element of an array by 2
36    public static void modifyArray( int array2[] )
37    {
38       for ( int counter = 0; counter < array2.length; counter++ )
39          array2[ counter ] *= 2;
40    } // end method modifyArray
41
42    // multiply argument by 2
43    public static void modifyElement( int element )
44    {
45       element *= 2;
46       System.out.printf(
47          "Value of element in modifyElement: %d\n", element );
48    } // end method modifyElement
49 } // end class PassArray
```

Pass array element `array[3]` to method `modifyElement`

Method `modifyArray` manipulates the array directly

Method `modifyElement` manipulates a primitive's copy

```
Effects of passing reference to entire array:
The values of the original array are:
   1   2   3   4   5

The values of the modified array are:
   2   4   6   8   10

Effects of passing array element value:
array[3] before modifyElement: 8
Value of element in modifyElement: 16
array[3] after modifyElement: 8
```

7.7 Passing Arrays to Methods (Cont.)

- **Notes on passing arguments to methods**
  - **Two ways to pass arguments to methods**
    - **Pass-by-value**
      - **Copy of argument's value is passed to called method**
      - **Every primitive type is passed-by-value**
    - **Pass-by-reference**
      - **Caller gives called method direct access to caller's data**
      - **Called method can manipulate this data**
      - **Improved performance over pass-by-value**
      - **Every object is passed-by-reference**
        - **Arrays are objects**
        - **Therefore, arrays are passed by reference**

© 1992-2007 Pearson Education, Inc. All rights reserved.

Performance Tip 7.1

Passing arrays by reference makes sense for performance reasons. If arrays were passed by value, a copy of each element would be passed. For large, frequently passed arrays, this would waste time and consume considerable storage for the copies of the arrays.

7.8 Case Study: Class GradeBook Using an Array to Store Grades

- **Further evolve class GradeBook**
- **Class GradeBook**
  - **Represents a grade book that stores and analyzes grades**
  - **Does not maintain individual grade values**
  - **Repeat calculations require reentering the same grades**
    - **Can be solved by storing grades in an array**

© 1992-2007 Pearson Education, Inc. All rights reserved.

Software Engineering Observation 7.1

A test harness (or test application) is responsible for creating an object of the class being tested and providing it with data. This data could come from any of several sources. Test data can be placed directly into an array with an array initializer, it can come from the user at the keyboard, it can come from a file (as you will see in Chapter 14), or it can come from a network (as you will see in Chapter 24). After passing this data to the class's constructor to instantiate the object, the test harness should call upon the object to test its methods and manipulate its data. Gathering data in the test harness like this allows the class to manipulate data from several sources.

```
Welcome to the grade book for
CS101 Introduction to Java Programming!

The grades are:

Student  1:  87
Student  2:  68
Student  3:  94
Student  4: 100
Student  5:  83
Student  6:  78
Student  7:  85
Student  8:  91
Student  9:  76
Student 10:  87

Class average is 84.90
Lowest grade is 68
Highest grade is 100

Grade distribution:
00-09:
10-19:
20-29:
30-39:
40-49:
50-59:
60-69: *
70-79: **
80-89: ****
90-99: **
  100: *

7.9 Multidimensional Arrays

- **Multidimensional arrays**
  - **Tables with rows and columns**
    - **Two-dimensional array**
    - **m-by-n array**

© 1992-2007 Pearson Education, Inc. All rights reserved.

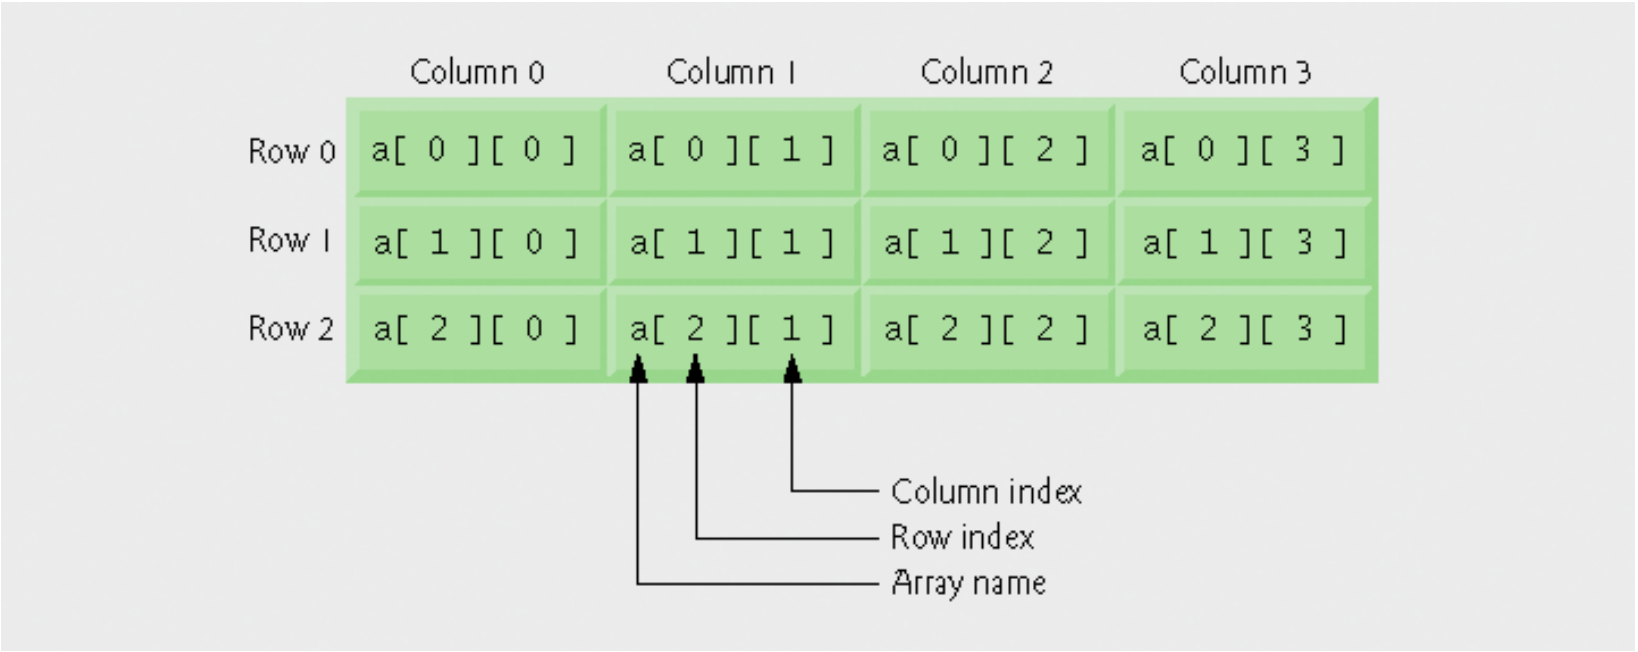

Fig. 7.16 | Two-dimensional array with three rows and four columns.

© 1992-2007 Pearson Education, Inc. All rights reserved.

7.9 Multidimensional Arrays (Cont.)

- **Arrays of one-dimensional array**
  - **Declaring two-dimensional array `b[2][2]`**

```
int b[][] = { { 1, 2 }, { 3, 4 } };
```

    - **`1` and `2` initialize `b[0][0]` and `b[0][1]`**
    - **`3` and `4` initialize `b[1][0]` and `b[1][1]`**

```
int b[][] = { { 1, 2 }, { 3, 4, 5 } };
```

    - **row `0` contains elements `1` and `2`**
    - **row `1` contains elements `3`, `4` and `5`**

© 1992-2007 Pearson Education, Inc. All rights reserved.

7.9 Multidimensional Arrays (Cont.)

- **Two-dimensional arrays with rows of different lengths**
  - **Lengths of rows in array are not required to be the same**
    - **E.g.,** `int b[][] = { { 1, 2 }, { 3, 4, 5 } };`

© 1992-2007 Pearson Education, Inc. All rights reserved.

7.9 Multidimensional Arrays (Cont.)

- **Creating two-dimensional arrays with array-creation expressions**
  - **3-by-4 array**

```
int b[][];
b = new int[ 3 ][ 4 ];
```

  - **Rows can have different number of columns**

```
int b[][];

b = new int[ 2 ][ ];   // create 2 rows
b[ 0 ] = new int[ 5 ]; // create 5 columns for row 0
b[ 1 ] = new int[ 3 ]; // create 3 columns for row 1
```

© 1992-2007 Pearson Education, Inc. All rights reserved.

```
1  // Fig. 7.17: InitArray.java
2  // Initializing two-dimensional arrays.
3
4  public class InitArray
5  {
6     // create and output two-dimensional arrays
7     public static void main( String args[] )
8     {
9        int array1[][] = { { 1, 2, 3 }, { 4, 5, 6 } };
10       int array2[][] = { { 1, 2 }, { 3 }, { 4, 5, 6 } };
11
12       System.out.println( "Values in array1 by row are" );
13       outputArray( array1 ); // displays array1 by row
14
15       System.out.println( "\nValues in array2 by row are" );
16       outputArray( array2 ); // displays array2 by row
17    } // end main
18
```

Use nested array initializers to initialize `array1`

Use nested array initializers of different lengths to initialize `array2`

23       for ( int row = 0; row < array.length; row++ )
24       {
25          // loop through columns of current row
26          for ( int column = 0; column < array[ row ].length; column++ )
27             System.out.printf( "%d  ", array[ row ][ column ] );
28
29          System.out.println(); // start new line of output
30       } // end outer for
31    } // end method outputArray
32 } // end class InitArray
```

`array[row].length` returns number of columns associated with `row` subscript

Use double-bracket notation to access two-dimensional array values

InitArray.java

(2 of 2)

Line 26

Line 27

```
Values in array1 by row are
1  2  3
4  5  6

Values in array2 by row are
1  2
3
4  5  6
```

7.9 Multidimensional Arrays (Cont.)

- **Common multidimensional-array manipulations performed with `for` statements**
  - **Many common array manipulations use `for` statements**

  E.g.,

```
for ( int column = 0; column < a[ 2 ].length; column++ )
     a[ 2 ][ column ] = 0;
```

© 1992-2007 Pearson Education, Inc. All rights reserved.

7.10 Case Study: Class GradeBook Using a Two-Dimensional Array

- Class GradeBook
  - One-dimensional array
    - Store student grades on a single exam
  - Two-dimensional array
    - Store grades for a single student and for the class as a whole

© 1992-2007 Pearson Education, Inc. All rights reserved.

```
1  // Fig. 7.18: GradeBook.java
2  // Grade book using a two-dimensional array to store grades.
3
4  public class GradeBook
5  {
6     private String courseName; // name of course this grade book represents
7     private int grades[][]; // two-dimensional array of student grades
8
9     // two-argument constructor initializes courseName and grades array
10    public GradeBook( String name, int gradesArray[][] )
11    {
12       courseName = name; // initialize courseName
13       grades = gradesArray; // store grades
14    } // end two-argument GradeBook constructor
15
16    // method to set the course name
17    public void setCourseName( String name )
18    {
19       courseName = name; // store the course name
20    } // end method setCourseName
21
22    // method to retrieve the course name
23    public String getCourseName()
24    {
25       return courseName;
26    } // end method getCourseName
27
```

Declare two-dimensional array grades

GradeBook constructor accepts a String and a two-dimensional array

Welcome to the grade book for
CS101 Introduction to Java Programming!

The grades are:

            Test 1  Test 2  Test 3  Average
Student  1      87      96      70    84.33
Student  2      68      87      90    81.67
Student  3      94     100      90    94.67
Student  4     100      81      82    87.67
Student  5      83      65      85    77.67
Student  6      78      87      65    76.67
Student  7      85      75      83    81.00
Student  8      91      94     100    95.00
Student  9      76      72      84    77.33
Student 10      87      93      73    84.33

Lowest grade in the grade book is 65
Highest grade in the grade book is 100

7.11 Variable-Length Argument Lists

- **Variable-length argument lists**
  - **Unspecified number of arguments**
  - **Use ellipsis (...) in method's parameter list**
    - **Can occur only once in parameter list**
    - **Must be placed at the end of parameter list**
  - **Array whose elements are all of the same type**

© 1992-2007 Pearson Education, Inc. All rights reserved.

```
1  // Fig. 7.20: VarargsTest.java
2  // Using variable-length argument lists.
3
4  public class VarargsTest
5  {
6     // calculate average
7     public static double average( double... numbers )
8     {
9        double total = 0.0; // initialize total
10
11       // calculate total using the enha
12       for ( double d : numbers )
13          total += d;
14
15       return total / numbe
16    } // end method average
17
18    public static void main( String args[] )
19    {
20       double d1 = 10.0;
21       double d2 = 20.0;
22       double d3 = 30.0;
23       double d4 = 40.0;
24
```

Method `average` receives a variable length sequence of `double`s

Calculate the total of the `double`s in the array

Access `numbers.length` to obtain the size of the `numbers` array

7.12 Using Command-Line Arguments

- **Command-line arguments**
  - **Pass arguments from the command line**
    - `String args[]`
  - **Appear after the class name in the `java` command**
    - `java MyClass a b`
  - **Number of arguments passed in from command line**
    - `args.length`
  - **First command-line argument**
    - `args[ 0 ]`

© 1992-2007 Pearson Education, Inc. All rights reserved.

```
1  // Fig. 7.21: InitArray.java
2  // Using command-line arguments to initialize an array.
3
4  public class InitArray
5  {
6     public static void main( String args[] )
7     {
8        // check number of command-line arguments
9        if ( args.length != 3 )
10          System.out.println(
11             "Error: Please re-enter                    " +
12             "an array                                  " );
13       else
14       {
15          // get array size from first command-line argument
16          int arrayLength = Integer.parseInt( args[ 0 ] );
17          int array[] = new int[ arrayLength ]; // create array
18
19          // get initial value and increment from co
20          int initialValue = Integer.parseInt( args[
21          int increment = Integer.parseInt( args[ 2 ] );
22
23          // calculate value for each array element
24          for ( int counter = 0; counter < array.le
25             array[ counter ] = initialValue + incr
26
27          System.out.printf( "%s%8s\n", "Index", "Value" );
28
```

Array `args` stores command-line arguments

Check number of arguments passed in from the command line

Obtain first command-line argument

Obtain second and third command-line arguments

Calculate the value for each array element based on command-line arguments
